Get Normal User names and UIDS of Linux using Ansible Playbook

Steps to write this playbook:

- Step1: Write Shell or Python script to get Normal Users and their UID's and export the data into a csv/directly as vars_file.
- Step2: If it is CSV then parse CSV file to Python and convert it to vars_file.
- Step3: Write a Playbook to get users_info and run it using ansible.

Thank you
