

Command Module

Ansible Ad-hoc Commands

- **Used to execute binary commands**
- **It is the default module**
- **With the Command module the command will be executed without being proceeded through a shell. As a consequence some variables like \$HOME are not available. And also stream operations like <, >, | and & will not work.**
- **The command module is more secure, because it will not be affected by the user's environment.**

Thank you
