

# Usage of register and set\_fact

## Simple Playbook to find the bash version of servers

Basic concepts to write Playbooks

- Ansible modules normally return a data structure that can be registered into a variable.
- Ansible **registers** are used to store the output of a module/task into a variable.
- We can then use the value of these registers for different scenarios like a conditional statement, logging etc.

- **set\_fact** module allows us to define new variables.

**Thank you**
