

Error Handling in Ansible Playbooks

Part - I

Ansible Playbooks – Error Handling

Error Handling

- Ansible normally has defaults that make sure to check the return codes of command/modules and it fails if return code is non-zero.
- If the current task fails then playbook will stop the executing remaining tasks on the host.
- Sometimes a task that returns non-zero but it is not an error
- Then use **ignore_errors: yes/true**
- Sometimes need to a fail a task if return code is 0 or any
- (Use failed_when)

Thank you
